

# Peak & Mating Nutritional Package

## MilkMAP Consulting

MilkMAP Consulting Ltd has the knowledge and resources to create custom plans that are:

- Specific to your situation
- Practical
- Effective
- Profitable
- Comprehensive

We have extensive experience in getting all types of breeds to a quick, high peak while ensuring the cows are not pushed too hard, and providing all the nutrients and minerals to give them the best opportunity for a successful mating.

With the predicted pay out over \$6.00 farms are in the position to capitalise on this forecast and consolidate debt and push profits. As we know, the variability of milk prices means that we cannot let a good season slide past. These opportunities must be seized and capitalised on.

## This Package

Will focus on delivering you a practical, achievable pasture management, feeding, and mineral plan to ensure that your cows will get to a quick, high peak, but well balanced to get in calf again for a profitable following season.

The cost of this package is \$3,000

## Comprehensive Advice and Planning to:

*Optimize the peak production and reproduction potential of your herd*

### Peak Production

For every extra litre you get at peak production per cow, you are enabling that cow to produce 200-250 additional litres over her lactation for that season.

The height, and speed to peak will determine the production throughout the rest of the season. A high peak will help the cows, and your business reach a higher economic result through more efficient utilisation of resources.

### Feeding Management

The diet, its components, pasture quality and consistency all play an important role in the milking cow. There are many pasture management and quality factors to master before the real benefits of supplementary feeding are seen. This package will enable you to make the right grazing decisions, at the time they need to be made so the rest of the diet can be fully utilised.

Careful ration balancing and implementation will mean that the cows will have all the right nutrients, fibre and allocation to perform at their most economical level now, and throughout the season.

### Mineral Management

Mineral supplementation can be the make or break of a sustainable dairy system. Implementing good feeding practices will increase production. Increased production will in-turn increase the mineral requirements of the cow. If these are not supplemented correctly, she will pull them from her reserves until normal function is compromised.

### Reproductive Success

We cannot measure our reproductive success from others failures. An objective review of reproductive KPIs must be made to determine if previous seasons results are sustainable and profitable.

### From this package

You will have a comprehensive nutritional and mineral plan with a sensitivity analysis for expected returns. You will have the tools and knowledge to best manage your pasture to optimise pasture growth and animal performance.
